

ABSTRACT OF DISCLOSURE

A nail enamel composition comprising, by weight of the total composition, about 10-95% solvent, and 5-95% of a film forming polymer having a glass transition temperature in the range of 5 to 90° Centigrade, and containing about 2 to 29% by weight of the total polymer of at least one polar monomer; a two container kit for polishing the nails containing the nail enamel composition of the invention and a second composition comprising 1-99% solvent and 1-99% of an film forming polymer; and method for polishing nails using the composition and kit of the invention.
